Launch of CRRU Ireland the Campaign for Responsible Rodenticide Use in Ireland.

<u>Launch of organization to raise awareness of the damage done to wildlife by</u> irresponsible rat poison use.

At the Ploughing championship today the Irish Campaign for Responsible Rodenticide Use was launched by the Minister for Agriculture, Food and the Marine Simon Coveney. Anticoagulant rodenticides used to kill rats and mice have been detected in many of our top predator wildlife species. Recent scientific research has shown that they now occur in over 80% of our barn owls who feed mainly on mice and rats. Other rodent-eating species such as kestrels, long eared owls, kites, buzzards as well as pine martens, stoats and foxes are all vulnerable too.

While pests such as mice and rats which can contaminate food and carry disease must be controlled, the rodenticide industry has recognised the need to protect and enhance wildlife. In order to ensure that rodenticides are used correctly and in ways that minimise the exposure of wildlife, the Campaign for Responsible Rodenticide Use (CRRU) has been initiated in Ireland. It has been set up under the chairmanship of Dr. Mark Lynch, former Senior Inspector in the Pesticides Control Service of the Dept of Agriculture and Food. It is supported by all the main manufacturers of second generation anticoagulant rodenticides that are in use in Ireland.

Poor pest control practice has a negative effect on wildlife. CRRU Ireland will be raising awareness of how to use rodenticides in a responsible manner by having a planned approach, by using enough baiting points and by never leaving bait around at the end of treatment. Owls and birds of prey play a role in keeping down rodent numbers around farms and food manufacturing plants. It is vital to ensure that rodents that are dead or dying after ingesting rodenticides are disposed of correctly and are not available to wildlife higher up the food chain.

Launching the company Minister for Agriculture Simon Coveney said "... I am very proud of the clean green image that our food products have, both here and overseas. It is equally important that we maintain this clean healthy reputation for our wildlife as well. While it is essential that rats be controlled it should be done in a manner that does not harm non-target species such as barn owls and kestrels".
